DLP recipe: exclude one labelled fixture

This is a configuration recipe for an isolated teaching fixture. It isn't an importable policy file. Replace the proposed fixture names only after checking the actual tenant; don't apply it to a production label by accident.

Setting	Proposed value
Policy name	Pearson-AB900-Copilot-Label-Demo
Template	Custom > Custom policy
Location	Microsoft 365 Copilot and Copilot Chat
Rule name	Exclude synthetic restricted guide
Condition	Content contains > Sensitivity labels
Selected label	Pearson Demo - Restricted (prepared fixture)
Action	Prevent Copilot from processing content
Initial mode	Simulation
Content	Synthetic file with harmless unique marker
Owner	Named demonstration administrator

Acceptance criteria

Configuration: the saved rule contains the selected label, location, action, and simulation mode. Enforcement: only after an authorized mode change, propagation, a successful baseline, and a controlled repeat test can the owner report an observed content-use restriction.

Don't use citation absence as the acceptance criterion. The file can remain in citations. Prompt-sensitive-information controls and file-grounding controls have different conditions and actions; this recipe demonstrates the latter.

Create and deploy a DLP policy

DSPM recipe: investigate the pilot's exposure

DSPM is a posture-management workflow, not a universally importable policy object. Current documentation covers DSPM and DSPM for AI (classic). This sample records the configuration decisions and resulting work rather than pretending that every tenant has the same wizard.

Decision	Sample configuration or record
Business scope	Contoso service-team pilot; approved service knowledge
Experience	Record DSPM or DSPM for AI (classic) as displayed
Sources	Prepared synthetic SharePoint site and labelled file
Finding	Broad source access inconsistent with intended audience
Responsible owner	Content owner for access; admin for control configuration
Recommended action	Review effective access, narrow it, and retest
Evidence	Finding scope/date, report period, baseline and retest
Release decision	Expand only after boundary and ownership tests pass

How this connects to DLP

A posture finding can lead to a DLP policy or permission correction, but the finding itself doesn't enforce the change. Review any recommended policy's location, condition, action, scope, and mode before creating it. Keep a separate source-access test and content-use test.

Retention and cleanup

Record which synthetic files and policies the course owns. Preserve evidence needed for the scheduled session. Don't delete shared labels, change tenant-wide plans, or remove unrelated site permissions as cleanup.
